# **String Interpolation in Angular 8**

August 1, 2019

#### **String Interpolation in Angular 8**

String interpolation is a one-way data-binding technique which is used to output the data from a typescript code to HTML template. It uses the template expression. It uses the template expression in double curly braces {{ }} to display the data from component to view.

String interpolation adds the value of the property from the component. It allows the user to bind the value to a UI element.

Interpolation binds the data one-way.

#### Syntax:

{{data}}

We have firstly created an Angular project using Angular CLI.

The syntax of binding a field using double curly braces is called **Binding Expression**.

^

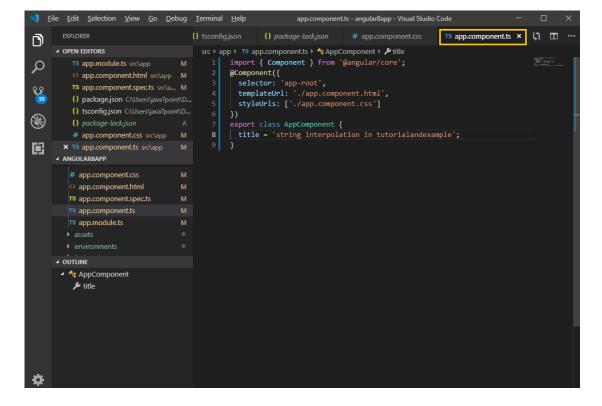

expression which can be run by angular, and the output will be inserted into the HTML.

### If we put $\{\{5+5\}\}\$ in the template ten will be inserted into the HTML.

Open the file app.component.ts and use the following code within the file:

```
import {Component} from '@angular/core';
@Component({
    selector: 'app-root',
    templateUrl:'./app.component.html',
    styleUrls: ['./app.component.css']
})
export class AppComponent {
    title='string interpolation in tutorialandexample';
}
```

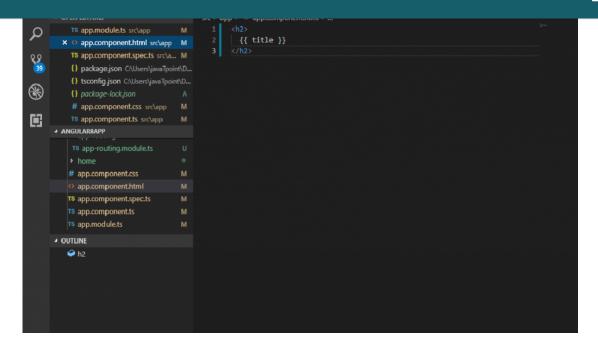

Now, open **app.component.html** file in the project and use the following code to see String Interpolation.

```
<h2>
{{ title}}
</h2>
```

Now, open Node.js command prompt and run the **ng serve –open** to open the localhost: 4200 to see the output of the program.

String interpolation can be used to solve some other expression too. Let's see another example.

#### **Example:**

Update the **app.component.ts** file with the following code:

```
import { Component } from '@angular/core';
@Component({
    selector: 'app-root',
    templateUrl: './app.component.html',
    styleUrls: ['./app.component.css']
})
export class AppComponent {
    title = 'Data binding example using String Interpolation';
    numberA: number = 10;
    numberB: number = 20;
}
```

```
import { Component } from '@angular/core';
2
                                                            @Component({
    selector: 'app-root',
    templateUrl: './app.component.html',
    styleUrls: ['./app.component.css']

⇔ app.component.html src\app M

           TS app.component.spec.ts src\a... M
           {} package.json C:\Users\javaTpoint\D...
           {} tsconfig.json C:\Users\javaTpoint\D...
                                                            export class AppComponent {
   title = 'Data binding example using String Interpolation';
        # app.component.css src\app M

X TS app.component.ts src\app M
                                                               numberA: number = 50;
                                                                 numberB: number = 15;
       ▲ ANGULAR8APP

■ app

           TS app-routing.module.ts U
           # app.component.css
          TS app.component.spec.ts M
          TS app.module.ts
       ▲ OUTLINE
        AppComponent
           ℱ numberA
          numberB
```

#### app.component.html:

<h2>Calculation is : {{ numberA + numberB }}</h2>

```
◆ app.component.html × TS app.component.spec.ts
ð
        TS app.module.ts src\app M
                                            1 <h2>Calculation is : {{ numberA + numberB }}</h2>
Q
       X ↔ app.component.html src\app M
         TS app.component.spec.ts src\a... M
        {} package.json C:\Users\javaTpoint\D...
         {} tsconfig.json C:\Users\javaTpoint\D...
         # app.component.css src\app M
TS app.component.ts src\app M

▲ ANGULAR8APP

         TS app.component.spec.ts
         TS app.component.ts
        TS app.module.ts
       ★ favicon.ico A

    h₂
```

**Output:** 

^

We can use the same application in another way also.

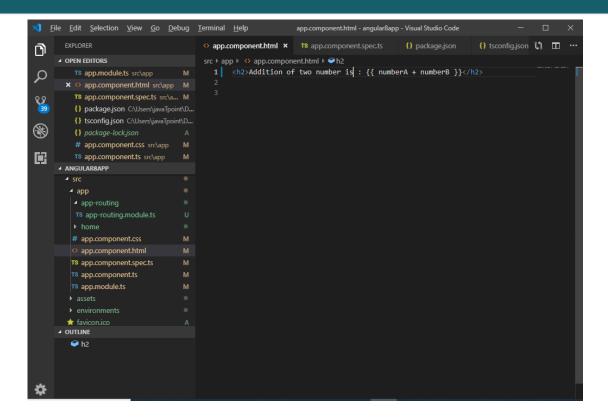

#### app.component.ts:

```
import { Component } from '@angular/core';
@Component({
    selector: 'app-root',
    templateUrl: './app.component.html',
    styleUrls: ['./app.component.css']
})
export class AppComponent {
    title = 'Data binding example using String Interpolation';
    numberA: number = 10;
    numberB: number = 20;
    addTwoNumbers() {
    return this.numberA + this.numberB;
}
```

### app.component.html:

^
